AUTHOR: Panuška, V.

TITLE: Modified method of Pfleiderer for design calculations
of centrifugal pumps

PERIODICAL: Strojírenství, 1961, Vol.11, No.8, pp.567-573

TEXT: Theoretical formulae on centrifugal pumps are inadequate and there is a great degree of uncertainty in design calculations of impellers. This applies to some extent to the delivery head for a given delivery but it applies to a much greater extent to the point of optimum efficiency, the Q-H curve and the suction ability of the pump. The formula of Pfleiderer does not contain any data on the width of the impeller, particularly at the outflow end; Pfleiderer gives recommendations of the radial outflow speed in terms of the ratio of the circumferential speed. Similarly, American and Soviet authors introduce that speed in terms of various coefficients as a function of the specific r.p.m. If the design calculations of the impeller are to be unequivocal, it is necessary to supplement the condition on the delivery head, i.e. the Euler equation, by the

Card 1/6

Modified method of Pfleiderer ... Z/032/61/011/008/001/009
E073/E535

condition of the flow rate on the basis of the loading of the individual impeller blades. In accordance with the analogy law of the changes in the parameters, it can be assumed that the specific pressure on the blade increases with increasing value of the square of the circumferential speed. The differential equation of the pump output can be written thus

$$Q \gamma dH = z p b dr r \omega,$$

and by introducing

$$p = k(r\omega)^2$$

we obtain

$$\begin{aligned} Q \gamma dH &= z k (r\omega)^2 b r \omega dr, \\ Q \gamma dH &= z b k \omega^3 r^3 dr, \\ Q \gamma H &= z k \omega^3 \int_{r_1}^{r_2} b r^3 dr, \end{aligned} \tag{1}$$

Card 2/6

24283

Modified method of Pfleiderer ...

Z/032/61/011/008/001/009
E073/E535

where Q - the flow rate, m^3/sec ; H - delivery head, m ;
 b - width of the impeller, m ; r - radius, m ; r_1, r_2 - roots and
 tips of the blades, m ; γ - specific gravity of the pumped liquid,
 kg/m^3 ; z - number of blades; k - coefficient, $\text{kg s}^2/\text{m}^4$, by means
 of which the specific load and $p = k (r\omega)^2$ is calculated;
 p - specific load of the blades, kg/m^2 , at the radius r .

It is advantageous to solve the integral $\int_{r_1}^{r_2} b r^3 dr$ graphically

since the relation between b and r cannot be determined by simple means and the graphical solution is accurate enough for practical requirements. Fig.1 shows the graphical solution of this differential equation. In this solution attention must be paid to the dimensions. In the case of an impeller of constant width, $b = \text{const}$. the equation simplifies to

$$Q \gamma H = z \omega^3 b k \int_{r_1}^{r_2} r^3 dr,$$

$$Q \gamma H = 1/4 z \omega^3 b k (r_2^4 - r_1^4). \quad (2)$$

Card 3/6

Modified method of Pfleiderer ...

24283
Z/032/61/011/008/001/009
E073/E535

The value of k was determined for a large number of impellers from drawings and from experimentally determined Q-H and Q- η curves. The k values of good and excellent quality pumps were plotted in a diagram as a function of ℓ_s/t_s , Fig.3, whereby the meaning of the symbols ℓ_s and t_s can be seen from Fig.2 (střední proudnice - mean stream line). It is remarkable that the coefficient k is not dependent on the specific r.p.m. This applies both to diagonal runner pumps and propeller pumps. The investigations also showed that optimum runners were not always combined with optimum guide vanes. The coefficient k was determined on the basis of the real delivery Q without taking into consideration losses at the sealing rings. On the basis of the here expressed additional condition, a number of new impellers were designed, all of which not only have a good efficiency but they have the optimum efficiency at the rated delivery. It was found that optimum designs have the highest efficiency when the product QH is highest, i.e. when the theoretical work of the pump is highest. Fig.4 shows a typical characteristic of a well designed pump; the optimum delivery is at

the point a. The application of the here derived relations is illustrated on the example of a centrifugal pump $Q = 60$ litres/sec, $H_{man} = 600$ m, $n = 1450$ r.p.m. Detailed calculations are carried out for pumps with 10, 6 and 4 blades, respectively. The here described method is also applicable for runner wheels of hydraulic turbines and turbocompressors. There are 8 figures and 3 tables.

TITLE: Tunnel diode capacitance meter

SOURCE: Sdelovaci technika, no. 9, 1964, 330-331

TOPIC TAGS: capacitance bridge, tunnel diode

ABSTRACT: Discussed is the problem of selecting a suitable capacitance meter for measuring parameters of tunnel diodes. A method is presented how to find the correct measuring frequency and check points guaranteeing a minimum in the measuring error. Description and diagrams of the meter are given. Reproducibility of measurement in capacities greater than 20pF is better than 5 percent. Orig. art. has: 7 formulas, 5 figures, 2 graphs.

✓ Micro-iodometric determination of guanine. A. Dmochowski and H. Panusz (Univ. Lodzki, Lodz, Poland). *Acta Biochim. Polon.* 1, 51-52 (1954). - A 0.1 ml. soln., contg. 30-50 μ guanine (I) in a 6-ml. volumetric flask was mixed with 0.2 ml. 0.02*N* iodine and 0.1 ml. 40% NaOH and left for 1.5-3 hrs. A blank soln. was treated identically. An excess of 2*N* H₂SO₄ (approx. 0.8 ml.) was added and the soln. titrated with 0.005*N* Na₂S₂O₃, with starch as indicator; 1 ml. of thiocyanate is equiv. to 120 μ iodine. The effect of excess NaOH, H₂SO₄, temp. variations and the time of addn. of indicator on the values of blank titrations was negligible. The oxidation of I was slower in more dil. iodine soln. In acid soln. no reaction takes place; in slightly alk. soln. the oxidation proceeds rapidly and 2 moles of iodine are used for 1 mole I; in 10% NaOH or more I is oxidized quantitatively in 40 min. using 3 moles of iodine for one of I. Reducing the temp. does not change the 3:1 ratio. Adenine is not oxidized under any of the above conditions. By this method the I content of scales of psoriasis vulgaris was 200 mg. %.

TITLE	:	Layout of a Radiochemical Laboratory for Work with Substances of Medium and High Radioactivity	
ORIG. PUBL.	:	Jaderna Energie, 5, No 2, 55-60 (1959)	
ABSTRACT	:	The layout of the physical chemistry laboratory at the Nuclear Physics institute, currently under construction in the Czech Peoples Republic, is described. The work of the laboratory will involve substances of medium and high alpha, beta, and gamma activity. The laboratory is divided into four sections, depending on the degree of radioactivity of the substances to be handled. The first section comprises the 'hot' laboratory for work with substances of very high activities.

TITLE: Heavy and Hydrated Concrete, Its Composition and Use

PERIODICAL: Jaderná Energie, 1960, Nr 2, pp 50 - 52

ABSTRACT: This article is an analysis of the types of concrete that are best suited for reactor shielding, i.e. screening off gamma and neutron radiation. The author stresses that ordinary concrete (specific gravity 2,300 kg/m³) is unsuited for screening off very intense gamma radiation, because extremely thick walls would be required. Ordinary concrete, the author holds, is absolutely unable to slow down neutrons, since water molecules - which are the chief deterrent agents - must be chemically bound with certain types of concrete. For nuclear technology, a concrete composition is needed which will bind about twice the quantity of water than ordinary concrete (ordinary concrete binds approximately 20% of its weight). Therefore, it is necessary to produce so-called hydrated concrete. The author considers limonite (2Fe₂O₃ · 3H₂O) a suitable mineral for the production of hydrated concrete and gives the compression strength and specific gravity of the only suitable limonite of Czechoslovak origin: 296 kg/m² and 3,230 kg/m³ respectively. This mineral is capable of binding water up

Card 1/3

66017

Heavy and Hydrated Concrete, Its Composition and Use

CZ/38-60-2-5/22

to 11% of its own weight. The author stresses that the reinforcement material of hydrated and heavy concrete must also have a high compression strength and a great specific gravity, in order to function as a shield against gamma radiation. Some data on reinforcement materials are given. The shielding capability of concrete necessitates two requirements: a) a certain specific gravity and b) a certain quantity of hydrogen in the form of chemically bound water in 1 m³ of concrete. It is emphasised that the concrete must also have sufficient bearing qualities and shows by the following formula the rate of cement needed in order to obtain sufficient compression strength, i.e. cubical strength:

$$K = 0.5 K_c \left(\frac{c}{v} - 0.5 \right)$$

Legend: K = cubical strength of concrete; K_c = type of cement; c = quantity of cement (kg) per 1 m³ of concrete; v = quantity of water (kg) per 1 m³ of concrete. Advising on the practical application of heavy and hydrated concrete the author points out that it was first used in Czechoslovakia in the construction of the ČSAV Nuclear Research Institute. Concrete of 3.2 t/m³, for instance, was used for the reactor shield which had a wall thickness of 2.5 m, while heavy concrete of 4.2 t/m³ was utilized

for the combustion chambers. In conclusion the author gives an analysis of the economic aspects related to the application of heavy concrete, including its prices.

TITLE: TR-0 heavy water zero-power reactor of Nuclear Research Institute of Czechoslovakian Academy of Sciences

SOURCE: Jaderna energie, no. 5, 1966, 161-165

TOPIC TAGS: research reactor, heavy water

ABSTRACT: The zero-power heavy water reactor TR-0, a pulsed neutron source and an exponential heavy water system, is described. This reactor has rod-shaped fuel elements of natural uranium. The active zone has a diameter of 3500 mm and a height up to 4000 mm. Its auxiliary layout was selected so that long-term studies on heavy water reactor lattices could be carried out. The principles of the long-term experimental program are outlined. The engineering solutions with respect to the reactor vessel and its system for the automatic adjustment of the lattice support and to the reactor circuits are described. The principal circuits considered are the heavy water circuit and the inert gas circuit in which dry air is used. A brief description is given of the construction work. This article was presented by F. Klik. Orig. art. has: 2 figures and 6 tables. [NA]

TITLE: Investigations on Increasing the Accuracy of Lathework by Compensating the Strain of the Elastic System of Lathe - Tool

PERIODICAL: Tr. Omskogo mashinostroit. in-ta, 1958, Nr 2, pp 165 - 175

ABSTRACT: A device (D) for the reduction of the effects of strain in the system of lathe - tool on the accuracy of lathe-machining hubs and gears is described. The D represents a cylindrical model, the spinning axis of which tallies with the axis of the workpiece to be machined. With the aid of an elastic part a roller is pressed against the workpiece, this roller being rigidly connected with the tool holder of the machine. Test results of D are given. The proposed device increases the accuracy of machining and permits to eliminate multi-cut operations (roughing and finishing) and to replace those by one-cut operations. 9 figures, 5 references.

	<p>206. Dihopeptides and amides free compounds in the intermediate products of acid hydrolysis of casein. A. N. Panyukov Biokhimia, 1956, 31, 58—107 (Chair of Biochem. Univ. Leningrad, U.S.S.R.).—The products of casein hydrolysis (mostly peptides) with H_2SO_4 at 100° were separated chromatographically into three fractions (acid, weakly acid, and alkaline). 0.1% of the NH_3 was split off in the first 5—5.5 hours. The weakly acid fraction contains peptides of the highest mol. wt. (up to acid residues). The acid fraction contains peptides of low mol. wt., free dicarboxylic acids and possibly some phosphoric acid. There is no great polydispersity (Russian)</p> <p>A. K. Grzybowski</p>	

PANYUKOV, A. N.

Chir. Biol. Chem.

The presence of cyclic peptides and of compounds of the amide type in the intermediary products of casein acid hydrolysis. A. N. Panyukov (A. A. Zhdanov State Univ., Leningrad). *Biochimika* 21, 98-107 (1956).—Technical grade casein was ptd. 3 times from a 0.1*N* NaOH so n. with 0.1*N* HCl. It contained 15.45% total N and 1.80% ish comtent. This was subjected to a complex procedure of hydrolysis consisting of several steps. Separation of the various products of casein hydrolysis was accomplished electrophoretically. Adequate descriptions are presented of the hydrolytic, electrophoretic, and analytical procedures used. In the process of heating casein in 1*N* H₂SO₄, 91% of the NH₃ is split off in the first 5.5 hrs. and this process is virtually complete at the end of 11 hrs. Ammonia N constitutes 10.4% of the total N of the intermediate products of casein hydrolysis. In the process of the electrophoretic separation of the intermediate products of casein hydrolysis the major part of the products is found in the weakly acid fraction and only a small quantity in the acid fraction. In the first step of casein hydrolysis 80.2% of the products were found to be peptides. In stage 1 of acid casein hydrolysis along with the dipeptides there are formed small quantities of free dicarboxylic amino acids. As the process of acid hydrolysis of casein progresses the particle size of the alk. and neutral fractions becomes reduced considerably while the particle size of the acid fractions are reduced to only a slight degree. The author is of the opinion that at all stages of the acid hydrolysis of casein the polydispersion of the fraction is not of a high order.
